

Dynamic Descaler®

Dynamic Descaler is a revolutionary liquid descaler that rapidly dissolves all water scale and lime; it also removes mud, rust, and other non-soluble sedimentation deposits safely and effectively.

It does not corrode, pit, erode or have any other harmful effects on materials and metals such as; steel, iron, brass, copper, plastic, fibre, teflon or other metals and materials found in water-based systems or equipment. You can clean your equipment in situ (and sometimes without shutting down your equipment)

Why use Dynamic Descaler?

- It is a safe non-toxic, biodegradable chemical to be used on the waterside of heat transfer equipment
- You do not have to heat Dynamic Descaler
- Equipment will be cleaned in only hours
- Cleans down to the original surface without pitting
- Dynamic Descaler will extend the usable life of your equipment, especially when used as part of a regular preventative maintenance programme
- Removing scale build up allows your equipment to operate more efficiently and with less down time

Stainless Steel and Aluminum

For long term stainless steel and aluminum applications we recommend D-Scale 518. It is ideal for stainless steel and aluminum holding tanks, reservoirs and other equipment.
